Load Dataset
Preprocess Data
Train using Random Forest Algorithm
1. Draw bootstrap samples from training data
2. For each decision tree:
a) Randomly select a subset of features (max_features = sqrt)
b) Build decision tree using configured parameters
3. Repeat for $N = 200$ trees
4. Aggregate predictions by averaging
Test on unseen test data
Evaluate model (MAE, RMSE, $R^2$)
Input new data
Predict hourly station-level departure demand
END
